#### 7.8.1 Detailed Description

Singleton class that manages the source of randomness in the library.

It consists of a wrapper around an `std::mt19937` Mersenne twister random number generator engine and an `std::random_device` engine. The latter is used to seed the Mersenne twister. The class also seeds the standard `std::srand` C number generator, as it is used by Eigen.

#### 7.9.1 Detailed Description

```
template<typename T>class qpp::internal::Singleton< T >
```

`Singleton` policy class, used internally to implement the singleton pattern via CRTP (Curiously recurring template pattern)

To implement a singleton, derive your class from `qpp::internal::Singleton`, make `qpp::internal::Singleton` a friend of your class, then declare the constructor of your class as private. To get an instance, use the static member function `qpp::internal::Singleton::get_instance()`, which returns a reference to your newly created singleton (thread-safe in C++11).

Example:

```
class MySingleton: public qpp::internal::Singleton<MySingleton>
{
    friend class qpp::internal::Singleton<MySingleton>;
public:
    // Declare all public members here
private:
    MySingleton()
```

```

    {
        // Implement the constructor here
    }
};

MySingleton& mySingleton = MySingleton::get_instance(); // Get an instance

```

### 7.11.1 Detailed Description

Measures time.

Uses a std::chrono::steady\_clock. It is not affected by wall clock changes during runtime.

### 7.11.2 Constructor & Destructor Documentation

#### 7.11.2.1 `qpp::Timer::Timer ( )` `[inline]`

Constructs an instance with the current time as the starting point.

### 7.11.3 Member Function Documentation

#### 7.11.3.1 `double qpp::Timer::seconds ( )` `const` `[inline]`

Time passed in seconds.

#### Returns

Number of seconds that passed between the instantiation/reset and invocation of `qpp::Timer::toc()`

#### 7.11.3.2 `void qpp::Timer::tic ( )` `[inline]`

Resets the chronometer.

Resets the starting/ending point to the current time

### 7.11.3.3 const Timer& qpp::Timer::toc ( ) [inline]

Stops the chronometer.

Set the current time as the ending point

#### Returns

Current instance

## 7.11.4 Friends And Related Function Documentation

### 7.11.4.1 std::ostream& operator<< ( std::ostream & *os*, const Timer & *rhs* ) [friend]

Overload for std::ostream operators.

#### Parameters

<i>os</i>	Output stream
<i>rhs</i>	<a href="#">Timer</a> instance

#### Returns

Writes to the output stream the number of seconds that passed between the instantiation/reset and invocation of [qpp::Timer::toc\(\)](#).
