Quantum++

Version 1.0.0-devel - development

Build status: Master [! \[Build Status\] \(https://api.travis-ci.org/vsoftco/qpp.svg?branch=master\)](https://api.travis-ci.org/vsoftco/qpp.svg?branch=master) Devel [! \[Build Status\] \(https://api.travis-ci.org/vsoftco/qpp.svg?branch=v1.0.0-devel\)](https://api.travis-ci.org/vsoftco/qpp.svg?branch=v1.0.0-devel)

Quantum++ is a modern C++11 general purpose quantum computing library, composed solely of template header files. Quantum++ is written in standard C++11 and has very low external dependencies, using only the [Eigen 3](#) linear algebra header-only template library and, if available, the [OpenMP](#) multi-processing library.

Quantum++ is not restricted to qubit systems or specific quantum information processing tasks, being capable of simulating arbitrary quantum processes. The main design factors taken in consideration were the ease of use, high portability, and high performance. The library's simulation capabilities are only restricted by the amount of available physical memory. On a typical machine (Intel i5 8Gb RAM) Quantum++ can successfully simulate the evolution of 25 qubits in a pure state or of 12 qubits in a mixed state reasonably fast.

To report any bugs or ask for additional features/enhancements, please [submit an issue](#) with an appropriate label.

If you are interesting in contributing to this project, please contact me. To contribute, you need to have a solid knowledge of C++ (preferably C++11), including templates and the standard library, a basic knowledge of quantum computing and linear algebra, and working experience with [Eigen 3](#).

For additional [Eigen 3](#) documentation see <http://eigen.tuxfamily.org/dox/>. For a simple [Eigen 3](#) quick ASCII reference see <http://eigen.tuxfamily.org/dox/AsciiQuickReference.txt>.

Building instructions

Configuration

- Compiler: [g++](#) version 4.8.2 or later (for good C++11 support)
- [Eigen 3](#) library located in \$HOME/eigen

- Quantum++ library located in `$HOME/qpp`

Optional

- **MATLAB** compiler include header files: `/Applications/MATLAB_R2016a.app/extern/include`
- **MATLAB** compiler shared library files: `/Applications/MATLAB_R2016a.app/bin/maci64`

Building using CMake (version 3.0.0 or later)

The current version of the repository has a `./CMakeLists.txt` configuration file for building examples using **CMake**. To build an example using **CMake**, I recommend an out-of-source build, i.e., from the root of the project (where `./include` is located), type

```
mkdir ./build
cd ./build
cmake ..
make
```

The commands above build the release version (default) executable `qpp`, from the source file `./examples/minimal.cpp`, without **MATLAB** support (default), inside the directory `./build`. To build a different configuration, e.g. debug version with **MATLAB** support, type from the root of the project

```
cd ./build
rm -rf *
cmake -DCMAKE_BUILD_TYPE=Debug -DWITH_MATLAB=ON ..
make
```

Or, to disable **OpenMP** support (enabled by default), type

```
cd ./build
rm -rf *
cmake -DWITH_OPENMP=OFF ..
make
```

To change the name of the example file, the location of the **Eigen 3** library or the location of **MATLAB** installation, edit the `./CMakeLists.txt` file. See also `./CMakeLists.txt` for additional options. Do not forget to clean the `./build` directory before a fresh build!

Building without an automatic build system

- Example file: `$HOME/qpp/examples/minimal.cpp`
- Output executable: `$HOME/qpp/examples/minimal`
- You must run the commands below from inside the directory `$HOME/qpp/examples`

Release version (without **MATLAB** support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -O3 -DNDEBUG -DEIGEN_NO_DEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    minimal.cpp -o minimal
```

Debug version (without **MATLAB** support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -g3 -DDEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    minimal.cpp -o minimal
```

Release version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-O3 -DNDEBUG -DEIGEN_NO_DEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
-I/Applications/MATLAB_R2016a.app/extern/include \
-L/Applications/MATLAB_R2016a.app/bin/maci64 \
-lmx -lmat minimal.cpp -o minimal
```

Debug version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
-g3 -DDEBUG \
-isystem $HOME/eigen -I $HOME/qpp/include \
-I /Applications/MATLAB_R2016a.app/extern/include \
-L /Applications/MATLAB_R2016a.app/bin/maci64 \
-lmx -lmat minimal.cpp -o minimal
```

Unit testing

Quantum++ was extensively tested via a suite of unit tests constructed with [Google Test 1.8.0](#) (included with the project in `./unit_tests/lib/gtest-1.8.0`). The source code of the unit tests is provided under `./unit_tests/tests`. To build and run the unit tests, I strongly recommend to use [CMake](#) version 3.0.0 or later. Assuming you do use [CMake](#), switch to the `./unit_tests` directory, create a build directory inside it, then from the newly created `./unit_tests/build` type

```
cmake ..
make
```

The commands above build `./unit_tests/build/tests/qpp_testing`, which you then may run.

Note

The [CMake](#) configuration file `./unit_tests/CMakeLists.txt` defines the same building options and default choices as the main `./CMakeLists.txt` of Quantum++. Therefore you can use the same flags as the ones mentioned at the beginning of this document when customizing the build. You should modify `./unit_tests/CMakeLists.txt` accordingly in case your [Eigen 3](#) library or [MATLAB](#) include/library files are in a different location than the one assumed in this document.

Additional remarks

- The C++ compiler must be fully standard-C++11 compliant.
- If using [Windows](#), I recommend compiling under [cygwin](#) via [CMake](#) and [g++](#). See also <http://stackoverflow.com/questions/28997206/cygwin-support-for-c11-in-g4-9-2> for a bug related to lack of support for some C++11 math functions, and how to fix it. Quick fix: patch the standard library header file `<cmath>` using the provided patch `./cmath_cygwin.patch`.
- In case you use [OS X](#) and want to install [clang++](#) version 3.7 or later, I highly recommend to install it via [macports](#).
- If you use [clang++](#) version 3.7 or later and want to use [OpenMP](#) (enabled by default), make sure to modify `CLANG_LIBOMP` and `CLANG_LIBOMP_INCLUDE` in `CMakeLists.txt` so they point to the correct location of the [OpenMP](#) library, as otherwise [clang++](#) will not find `<omp.h>` and the `libomp` shared library.
- If you run the program on [OS X](#) with [MATLAB](#) support, make sure that the environment variable `DYLD_LIBRARY_PATH` is set to point to the [MATLAB](#) compiler library location, see the `run_OSX_MATLAB` script. Otherwise, you get a runtime error similar to

```
> dyld: Library not loaded: @rpath/libmat.dylib.
```

- I recommend running via a script, as otherwise setting the `DYLD_LIBRARY_PATH` globally may interfere with `macports`' `CMake` installation (in case you use `CMake` from `macports`). If you use a script, then the environment variable is local to the script and does not interfere with the rest of the system.
- Example of script, assumed to be located in the root directory of Quantum++

```
#!/bin/sh

MATLAB=/Applications/MATLAB_R2016a.app
export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:$MATLAB/bin/maci64

./build/qpp
```

- If you build a debug version with `g++` under `OS X` and use `gdb` to step inside template functions you may want to add `-fno-weak` compiler flag. See <http://stackoverflow.com/questions/23330641/gnu-gdb-can-not-step-into-template-functions-os-x-mavericks> for more details about this problem.

7.4.1 Detailed Description

const Singleton class that implements most commonly used gates

7.4.2 Constructor & Destructor Documentation

7.4.2.1 `qpp::Gates::Gates ()` `[inline]`, `[private]`

Initializes the gates.

7.4.2.2 `qpp::Gates::~~Gates ()` `[private]`, `[default]`

Default destructor.

7.4.3 Member Function Documentation

7.4.3.1 `template<typename Derived > dyn_mat<typename Derived::Scalar> qpp::Gates::CTRL (const Eigen::MatrixBase<Derived > & A, const std::vector< idx > & ctrl, const std::vector< idx > & subsys, idx N, idx d = 2) const` `[inline]`

Generates the multi-partite multiple-controlled- A gate in matrix form.

See also

[qpp::applyCTRL\(\)](#)

Note

The dimension of the gate A must match the dimension of *subsys*

Parameters

A	Eigen expression
<i>ctrl</i>	Control subsystem indexes
<i>subsys</i>	Subsystem indexes where the gate A is applied
N	Total number of subsystems
d	Subsystem dimensions

Returns

CTRL- A gate, as a matrix over the same scalar field as A

Expands out.

See also

[qpp::kron\(\)](#)

Expands out A as a matrix in a multi-partite system. Faster than using [qpp::kron](#)($I, I, \dots, I, A, I, \dots, I$).

Parameters

<i>A</i>	Eigen expression
<i>pos</i>	Position
<i>dims</i>	Dimensions of the multi-partite system

Returns

Tensor product $I \otimes \dots \otimes I \otimes A \otimes I \otimes \dots \otimes I$, with A on position pos , as a dynamic matrix over the same scalar field as A

7.4.3.3 `template<typename Derived > dyn_mat<typename Derived::Scalar> qpp::Gates::expandout (const Eigen::MatrixBase< Derived > & A, idx pos, const std::initializer_list< idx > & dims) const [inline]`

Expands out.

See also

[qpp::kron\(\)](#)

Expands out A as a matrix in a multi-partite system. Faster than using [qpp::kron\(I, I, ..., I, A, I, ..., I\)](#).

Note

The `std::initializer_list` overload exists because otherwise, in the degenerate case when $dims$ has only one element, the one element list is implicitly converted to the element's underlying type, i.e. [qpp::idx](#), which has the net effect of picking the wrong (non-vector) `qpp::expandout()` overload

Parameters

<i>A</i>	Eigen expression
<i>pos</i>	Position
<i>dims</i>	Dimensions of the multi-partite system

Returns

Tensor product $I \otimes \dots \otimes I \otimes A \otimes I \otimes \dots \otimes I$, with A on position pos , as a dynamic matrix over the same scalar field as A

7.4.3.4 `template<typename Derived > dyn_mat<typename Derived::Scalar> qpp::Gates::expandout (const Eigen::MatrixBase< Derived > & A, idx pos, idx N, idx d=2) const [inline]`

Expands out.

See also

[qpp::kron\(\)](#)

<i>N</i>	Number of subsystems
<i>d</i>	Subsystem dimension

Returns

Tensor product $I \otimes \cdots \otimes I \otimes A \otimes I \otimes \cdots \otimes I$, with A on position pos , as a dynamic matrix over the same scalar field as A

7.4.3.6 template<typename Derived = Eigen::MatrixXcd> Derived qpp::Gates::Id (idx $D=2$) const [inline]

Identity gate.

Note

Can change the return type from complex matrix (default) by explicitly specifying the template parameter

Parameters

<i>D</i>	Dimension of the Hilbert space
----------	--------------------------------

Returns

Identity gate on a Hilbert space of dimension D

7.4.3.7 cmat qpp::Gates::Rn (double *theta*, const std::vector< double > & *n*) const [inline]

Qubit rotation of *theta* about the 3-dimensional real (unit) vector *n*.

7.15.1 Detailed Description

Singleton class that manages the source of randomness in the library.

Consists of a wrapper around an `std::mt19937` Mersenne twister random number generator engine and an `std::random_device` engine. The latter is used to seed the Mersenne twister.

Warning

This class DOES NOT seed the standard C number generator used by `Eigen::Matrix::Random()`, since it is not thread safe. Do not use `Eigen::Matrix::Random()` or functions that depend on the C style random number engine, but use `qpp::rand()` instead!

7.16.1 Detailed Description

template<typename T>class qpp::internal::Singleton< T >

[Singleton](#) policy class, used internally to implement the singleton pattern via CRTP (Curiously recurring template pattern)

To implement a singleton, derive your class from [qpp::internal::Singleton](#), make [qpp::internal::Singleton](#) a friend of your class, then declare the constructor and destructor of your class as private. To get an instance, use the static member function [qpp::internal::Singleton::get_instance\(\)](#) ([qpp::internal::Singleton::get_thread_local_instance\(\)](#)), which returns a reference (thread_local reference) to your newly created singleton (thread-safe in C++11).

Example:

```
class MySingleton: public qpp::internal::Singleton<MySingleton>
{
    friend class qpp::internal::Singleton<MySingleton>;
public:
    // Declare all public members here
private:
    MySingleton()
    {
        // Implement the constructor here
    }
    ~MySingleton()
    {
        // Implement the destructor here
    }
};

MySingleton& mySingleton = MySingleton::get_instance(); // Get an instance
thread_local MySingleton& tls = MySingleton::get_thread_local_instance();
// Get a thread_local instance
```
