Quantum++

Version 1.0.0-devel

Quantum++ is a modern C++11 general purpose quantum computing library, composed solely of template header files. Quantum++ is written in standard C++11 and has very low external dependencies, using only the Eigen 3 linear algebra header-only template library and, if available, the OpenMP multi-processing library.

Quantum++ is not restricted to qubit systems or specific quantum information processing tasks, being capable of simulating arbitrary quantum processes. The main design factors taken in consideration were the ease of use, high portability, and high performance.

If you are interesting in contributing, please contact me. To contribute, you need to have a good knowledge of C++ (preferably C++11), including templates and the standard library, a basic knowledge of quantum computing and linear algebra, and working experience with Eigen 3.

For additional Eigen 3 documentation see http://eigen.tuxfamily.org/dox/. For a simple Eigen 3 quick ASCII reference see http://eigen.tuxfamily.org/dox/AsciiQuickReference.txt.

Building instructions

Configuration:

- Compiler: g++ version 4.8.2 or later (for good C++11 support)

- Eigen 3 library located in $HOME/eigen

- Quantum++ library located in $HOME/qpp

Optional:

- MATLAB compiler include header files: /Applications/MATLAB_R2016a.app/extern/include

- MATLAB compiler shared library files: /Applications/MATLAB_R2016a.app/bin/maci64

Building using `cmake` **(version 3.0.0 or later)**

The current version of the repository has a `./CMakeLists.txt` configuration file for building examples using `cmake`. To build an example using `cmake`, I recommend an out-of-source build, i.e., from the root of the project (where `./include` is located), type

```
mkdir ./build
cd ./build
cmake ..
make
```

The above commands build the relase version (default) executable `qpp`, from the source file `./examples/minimal.cpp`, without `MATLAB` support (default), inside the directory `./build`. To build a different configuration, e.g. debug version with `MATLAB` support, type from the root of the project

```
cd ./build
rm -rf *
cmake -DCMAKE_BUILD_TYPE=Debug -DWITH_MATLAB=ON ..
make
```

Or, to disable `OpenMP` support (enabled by default), type

```
cd ./build
rm -rf *
cmake -DWITH_OPENMP=OFF ..
make
```

To change the name of the example file, the location of the `Eigen 3` library or the location of `MATLAB` installation, edit the `./CMakeLists.txt` file. See also `./CMakeLists.txt` for additional options. Do not forget to clean the `./build` directory before a fresh build!

Building without an automatic build system

- Example file: `$HOME/qpp/examples/minimal.cpp`

- Output executable: `$HOME/qpp/examples/minimal`

- You must run the commands below from inside the directory `$HOME/qpp/examples`

Release version (without `MATLAB` **support):**

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -O3 -DNDEBUG -DEIGEN_NO_DEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    minimal.cpp -o minimal
```

Debug version (without `MATLAB` **support):**

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -g3 -DDEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
     minimal.cpp -o minimal
```

Release version (with `MATLAB` **support):**

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -O3 -DNDEBUG -DEIGEN_NO_DEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    -I/Applications/MATLAB_R2016a.app/extern/include \
    -L/Applications/MATLAB_R2016a.app/bin/maci64 \
    -lmx -lmat minimal.cpp -o minimal
```

Debug version (with MATLAB **support):**

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -g3 -DDEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    -I /Applications/MATLAB_R2016a.app/extern/include \
    -L /Applications/MATLAB_R2016a.app/bin/maci64 \
    -lmx -lmat minimal.cpp -o minimal
```

Unit testing

Google Test 1.8.0 is included with the project. I strongly recommend to use cmake version 3.0.0 or later as a building system. By default the current CMakeLists.txt automatically builds all unit tests as ./build/unit_tests/tests/qpp_testing. To build without unit tests, type

```
cmake -DWITH_UNIT_TESTS=OFF ..
make
```

from inside ./build.

Additional remarks

- The C++ compiler must be C++11 compliant.

- If using Windows, I recommend compiling under cygwin via cmake and g++. See also http←
  ://stackoverflow.com/questions/28997206/cygwin-support-for-c11-in-g4-9-2
  for a bug related to lack of support for some C++11 math functions, and how to fix it. Quick fix: patch the
  standard library header file <cmath> using the provided patch ./cmath_cygwin.patch.

- If your compiler does not support OpenMP (as it is the case e.g with clang++ pre version 3.7), disable
  OpenMP in your build, as otherwise the linker may not find the gomp library.

- If you run the program on OS X with MATLAB support, make sure that the environment variable DYLD_L←
  IBRARY_PATH is set to point to the MATLAB compiler library location, see the run_OSX_MATLAB script.
  Otherwise, you will get a runtime error like dyld: Library not loaded: @rpath/libmat.←
  dylib.

  ```
  * I recommend running via a script, as otherwise setting the
  'DYLD_LIBRARY_PATH' globally may interfere with
  [macports](https://www.macports.org/)' [cmake](http://www.cmake.org/)
  installation (in case you use [cmake](http://www.cmake.org/) from
  [macports](https://www.macports.org/)). If you use a script,
  then the environment variable is local to the script and
  does not interfere with the rest of the system.

  * Example of script, assumed to be located in the root directory
  of Quantum++:

          #!/bin/sh

          MATLAB=/Applications/MATLAB_R2016a.app
          export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:$MATLAB/bin/maci64

          ./build/qpp
  ```

- If you build a debug version with g++ under OS X and use gdb to step inside template func-
  tions you may want to add -fno-weak compiler flag. See http://stackoverflow.←
  com/questions/23330641/gnu-gdb-can-not-step-into-template-functions-os-x-mavericks
  for more details about this problem.

Abstract class (interface) that mandates the definition of virtual std::ostream& display(std::ostream& os) const.

This class defines friend inline std::ostream& operator$<<$ (std::ostream& os, const qpp::IDisplay& rhs). The latter delegates the work to the pure private virtual function qpp::IDisplay::display() which has to be overridden by all derived classes.

7.16.1 Detailed Description

Singeleton class that manages the source of randomness in the library.

Consists of a wrapper around an std::mt19937 Mersenne twister random number generator engine and an std↩ ::random_device engine. The latter is used to seed the Mersenne twister.

Warning

> This class DOES NOT seed the standard C number generator used by Eigen::Matrix::Random(), since it is not thread safe. Do not use Eigen::Matrix::Random() or functions that depend on the C style random number engine, but use qpp::rand() instead!

7.17.1 Detailed Description

template<**typename T**>**class qpp::internal::Singleton**< **T** >

Singleton policy class, used internally to implement the singleton pattern via CRTP (Curiously recurring template pattern)

To implement a singleton, derive your class from qpp::internal::Singleton, make qpp::internal::Singleton a friend of your class, then declare the constructor and destructor of your class as private. To get an instance, use the static member function qpp::internal::Singleton::get_instance() (qpp::internal::Singleton::get_thread_local_↩ instance()), which returns a reference (thread_local reference) to your newly created singleton (thread-safe in C++11).

Example:

```
class MySingleton: public qpp::internal::Singleton<MySingleton>
{
        friend class qpp::internal::Singleton<MySingleton>;
public:
    // Declare all public members here
private:
    MySingleton()
    {
        // Implement the constructor here
    }
    ~MySingleton()
    {
        // Implement the destructor here
    }
};

MySingleton& mySingleton = MySingleton::get_instance(); // Get an instance
thread_local MySingleton& tls = MySingleton::get_thread_local_instance();
// Get a thread_local instance
```
