Quantum++ is a modern C++11 general purpose quantum computing library, composed solely of template header files. Quantum++ is written in standard C++11 and has very low external dependencies, using only the `Eigen 3` linear algebra header-only template library and, if available, the `OpenMP` multi-processing library.

Quantum++ is not restricted to qubit systems or specific quantum information processing tasks, being capable of simulating arbitrary quantum processes. The main design factors taken in consideration were the ease of use, high portability, and high performance. The library's simulation capabilities are only restricted by the amount of available physical memory. On a typical machine (Intel i5 8Gb RAM) Quantum++ can successfully simulate the evolution of 25 qubits in a pure state or of 12 qubits in a mixed state reasonably fast.

To report any bugs or ask for additional features/enhancements, please `submit an issue` with an appropriate label.

If you are interesting in contributing to this project, please contact me. To contribute, you need to have a solid knowledge of C++ (preferably C++11), including templates and the standard library, a basic knowledge of quantum computing and linear algebra, and working experience with `Eigen 3`.

For additional `Eigen 3` documentation see `http://eigen.tuxfamily.org/dox/`. For a simple `Eigen 3` quick ASCII reference see `http://eigen.tuxfamily.org/dox/AsciiQuickReference.txt`.

Building instructions for POSIX-compliant platforms

Configuration

- Compiler: `g++` version 4.8.2 or later (for good C++11 support)

- `Eigen 3` library located in `$HOME/eigen`

- Quantum++ library located in `$HOME/qpp`

Optional

- CMake version 3.0.0 or later, highly recommended

- MATLAB compiler include header files: `/Applications/MATLAB_R2016a.app/extern/include`

- MATLAB compiler shared library files: `/Applications/MATLAB_R2016a.app/bin/maci64`

Building using CMake (version 3.0.0 or later)

The current version of the repository has a `./CMakeLists.txt` configuration file for building examples using CMake. To build an example using CMake, I recommend an out-of-source build, i.e., from the root of the project (where `./include` is located), type

```
mkdir ./build
cd ./build
cmake ..
make
```

The commands above build the relase version (default) executable `qpp`, from the source file `./examples/minimal.cpp`, without MATLAB support (default), inside the directory `./build`. To build a different configuration, e.g. debug version with MATLAB support, type from the root of the project

```
cd ./build
rm -rf *
cmake -DCMAKE_BUILD_TYPE=Debug -DWITH_MATLAB=ON ..
make
```

Or, to disable OpenMP support (enabled by default), type

```
cd ./build
rm -rf *
cmake -DWITH_OPENMP=OFF ..
make
```

To change the name of the example file, the location of the Eigen 3 library or the location of MATLAB installation, edit the `./CMakeLists.txt` file. See also `./CMakeLists.txt` for additional options. Do not forget to clean the `./build` directory before a fresh build!

Building without an automatic build system

- Example file: `$HOME/qpp/examples/minimal.cpp`

- Output executable: `$HOME/qpp/examples/minimal`

- You must run the commands below from inside the directory `$HOME/qpp/examples`

Release version (without MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -O3 -DNDEBUG -DEIGEN_NO_DEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    minimal.cpp -o minimal
```

Debug version (without MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -g3 -DDEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
     minimal.cpp -o minimal
```

Release version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -O3 -DNDEBUG -DEIGEN_NO_DEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    -I/Applications/MATLAB_R2016a.app/extern/include \
    -L/Applications/MATLAB_R2016a.app/bin/maci64 \
    -lmx -lmat minimal.cpp -o minimal
```

Debug version (with MATLAB support)

```
g++ -pedantic -std=c++11 -Wall -Wextra -Weffc++ -fopenmp \
    -g3 -DDEBUG \
    -isystem $HOME/eigen -I $HOME/qpp/include \
    -I /Applications/MATLAB_R2016a.app/extern/include \
    -L /Applications/MATLAB_R2016a.app/bin/maci64 \
    -lmx -lmat minimal.cpp -o minimal
```

Additional building instructions for particular platforms

Windows via Cygwin

- Some earlier versions of Cygwin had a bug related to lack of support for some C++11 math functions, see http://stackoverflow.com/questions/28997206/cygwin-support-for-c11-in-g4-9-2 for more details. Quick fix: patch the standard library header file <cmath> using the provided patch ./cmath_cygwin.patch. Latest Cygwin (as of Nov. 11, 2016) seem to have fixed the issue.

Windows via Visual Studio

- Visual Studio versions preceeding version 2015 do not have full C++11 support. If you decide to use Visual Studio make sure you install version 2015 or later.

- Visual Studio 2015 only supports OpenMP 2.0. Quantum++ uses features from OpenMP 3.←
  0, hence Quantum++ will not compile on Visual Studio 2015 if you enable OpenMP (disabled by default) in

  ```
  *Project/Properties/Configuration Properties/C_C++/Language/Open MP Support*
  ```

and #define WITH_OPENMP_ in your source file.

- To create a Visual Studio 2015 or later console solution, start by creating a *Win32 Console Application*

  ```
  *File/New/Project.../Installed/Templates/Visual C++/Win32/Win32 Console Application*

  Click *Next* then select *Console Application* as *Application Type*.
  Click *Finish* to create the solution. Next select

  *Project/Properties*

  from the main menu. The *Property Pages* configuration window will open.
  From the latter select *All configurations* from the top left
  *Configuration* drop box. Next select

  *Configuration Properties/C_C++/General*

  and add to the field *Additional Include Directories* the location of
  Quantum++ './include' folder as well as the location of
  [Eigen 3](http://eigen.tuxfamily.org). It should look similar to

  **C:\Users\User\Downloads\eigen;C:\Users\User\Downloads\qpp\include;%(AdditionalIncludeDirectories)**

  Finally select

  *Configuration Properties/C_C++/Advanced*
  ```

```
and add to the field *Disable Specific Warnings* the values **4503;4996**.
Click *Ok* to save the settings and close the *Property Pages* window.
You are now ready to go.
```

OS X/macOS

- If you want to compile with `clang++` version 3.7 or later, I highly recommend to install it via `macports`.

- If you run the program with MATLAB support, make sure that the environment variable DYLD_LIBRARY_↩ PATH is set to point to the MATLAB compiler library location, see the run_mac_MATLAB script. Otherwise, you get a runtime error similar to

   ```
   > dyld: Library not loaded: @rpath/libmat.dylib.
   ```

  - I recommend running via a script, as otherwise setting the DYLD_LIBRARY_PATH globally may interfere with `macports`' CMake installation (in case you use CMake from `macports`). If you use a script, then the environment variable is local to the script and does not interfere with the rest of the system.
  - Example of script, assumed to be located in the root directory of Quantum++

      ```
      #!/bin/sh

      MATLAB=/Applications/MATLAB_R2016a.app
      export DYLD_LIBRARY_PATH=$DYLD_LIBRARY_PATH:$MATLAB/bin/maci64

      ./build/qpp
      ```

- If you build a debug version with `g++` and use `gdb` to step inside template functions you may want to add `-fno-weak` compiler flag. See http://stackoverflow.com/questions/23330641/gnu-gdb-can-not-st for more details about this problem.

Unit testing

Quantum++ was extensively tested under multiple flavours of Linux, OS X/macOS, Windows XP/7/10, Solaris 11.x via a suite of unit tests constructed with Google Test 1.8.0 (included with the project in ./unit_tests/lib/gtest-1.8.0). The source code of the unit tests is provided under ./unit↩ _tests/tests. To build and run the unit tests, I strongly recommend to use CMake version 3.0.0 or later. Assuming you do use CMake, switch to the ./unit_tests directory, create a build directory inside it, then from the newly created ./unit_tests/build type

```
cmake ..
make
```

The commands above build ./unit_tests/build/tests/qpp_testing, which you then may run. Note that qpp::Timer tests or tests related to random functions such as qpp::rand() may sometime (very rarely) fail, due to timing imprecision or statistical errors. Such a behaviour is perfectly normal.

Note

The CMake configuration file ./unit_tests/CMakeLists.txt defines the same building options and default choices as the main ./CMakeLists.txt of Quantum++. Therefore you can use the same flags as the ones mentioned at the beginning of this document when customizing the build. You should modify ./unit_↩ tests/CMakeLists.txt accordingly in case your Eigen 3 library or MATLAB include/library files are in a different location than the one assumed in this document.

Additional remarks

- If you use `clang++` version 3.7 or later and want to use OpenMP (enabled by default), make sure to modify CLANG_LIBOMP and CLANG_LIBOMP_INCLUDE in CMakeLists.txt so they point to the correct location of the OpenMP library, as otherwise `clang++` will not find <omp.h> and the libomp shared library.

7.10.1 Detailed Description

Base class for generating Quantum++ custom exceptions.

Derive from this class if more exceptions are needed, making sure to override qpp::exception::Exception::type_↩
description() in the derived class and to inherit the constructor qpp::exception::Exception::Exception(). Preferably keep your newly defined exception classes in the namespace qpp::exception.

Example:

```
namespace qpp
{
namespace exception
{
    class ZeroSize : public Exception
    {
    public:
        std::string type_description() const override
        {
            return "Object has zero size";
        }

        // inherit the base class' qpp::exception::Exception constructor
        using Exception::Exception;
```

```
    };
} // namespace exception
} // namespace qpp
```

Generates the multi-partite multiple-controlled-*A* gate in matrix form.

See also

> qpp::applyCTRL()

Note

> The dimension of the gate *A* must match the dimension of *subsys*

Parameters

A	Eigen expression
ctrl	Control subsystem indexes
subsys	Subsystem indexes where the gate *A* is applied
N	Total number of subsystems
d	Subsystem dimensions

Returns

> CTRL-A gate, as a matrix over the same scalar field as *A*

7.11.3.2 template<typename Derived > dyn_mat<typename Derived::Scalar> qpp::Gates::expandout (const Eigen::MatrixBase< Derived > & *A,* idx *pos,* const std::vector< idx > & *dims*) const `[inline]`

Expands out.

See also

> qpp::kron()

Expands out *A* as a matrix in a multi-partite system. Faster than using qpp::kron(I, I, ..., I, A, I, ..., I).

Parameters

A	Eigen expression
pos	Position
dims	Dimensions of the multi-partite system

Returns

Tensor product $I \otimes \cdots \otimes I \otimes A \otimes I \otimes \cdots \otimes I$, with *A* on position *pos*, as a dynamic matrix over the same scalar field as *A*

7.11.3.3 template$<$**typename Derived** $>$ **dyn_mat**$<$**typename Derived::Scalar**$>$ **qpp::Gates::expandout (const Eigen::MatrixBase**$<$ **Derived** $>$ **& *A*, idx *pos*, const std::initializer_list**$<$ **idx** $>$ **& *dims*) const** `[inline]`

Expands out.

See also

qpp::kron()

Expands out *A* as a matrix in a multi-partite system. Faster than using qpp::kron(I, I, ..., I, A, I, ..., I).

Note

The std::initializer_list overload exists because otherwise, in the degenerate case when *dims* has only one element, the one element list is implicitly converted to the element's underlying type, i.e. qpp::idx, which has the net effect of picking the wrong (non-vector) qpp::expandout() overload

Parameters

A	Eigen expression
pos	Position
dims	Dimensions of the multi-partite system

Returns

Tensor product $I \otimes \cdots \otimes I \otimes A \otimes I \otimes \cdots \otimes I$, with *A* on position *pos*, as a dynamic matrix over the same scalar field as *A*

7.11.3.4 template$<$**typename Derived** $>$ **dyn_mat**$<$**typename Derived::Scalar**$>$ **qpp::Gates::expandout (const Eigen::MatrixBase**$<$ **Derived** $>$ **& *A*, idx *pos*, idx *N*, idx *d* =** 2 **) const** `[inline]`

Expands out.

See also

qpp::kron()

Expands out *A* as a matrix in a multi-partite system. Faster than using qpp::kron(I, I, ..., I, A, I, ..., I).

Parameters

A	Eigen expression

pos	Position
N	Number of subsystems
d	Subsystem dimension

Returns

Tensor product $I \otimes \cdots \otimes I \otimes A \otimes I \otimes \cdots \otimes I$, with *A* on position *pos*, as a dynamic matrix over the same scalar field as *A*

7.11.3.5 cmat qpp::Gates::Fd (idx *D* = 2) const `[inline]`

Parameters

Returns

Fourier transform gate for qudits

7.11.3.6 template<typename Derived = Eigen::MatrixXcd> Derived qpp::Gates::Id (idx *D* = 2) const `[inline]`

Identity gate.

Note

Can change the return type from complex matrix (default) by explicitly specifying the template parameter

Parameters

Returns

7.11.3.7 cmat qpp::Gates::Rn (double *theta,* const std::vector< double > & *n*) const `[inline]`

n	3-dimensional real (unit) vector

Returns

Returns

7.12.1 Detailed Description

Abstract class (interface) that mandates the definition of virtual std::ostream& display(std::ostream& os) const.

This class defines friend inline std::ostream& operator$<<$ (std::ostream& os, const qpp::IDisplay& rhs). The latter delegates the work to the pure private virtual function qpp::IDisplay::display() which has to be overridden by all derived classes.

7.12.2 Constructor & Destructor Documentation

7.12.3 Member Function Documentation

7.12.3.1 virtual std::ostream& qpp::IDisplay::display (std::ostream & *os*) const `[private]`,`[pure virtual]`

Must be overridden by all derived classes.

The actual stream extraction processing is performed by the overriden member function in the derived class. This function is automatically invoked by friend inline std::ostream& operator$<<$(std::ostream& os, const IDisplay& rhs).

Implemented in qpp::internal::IOManipEigen, qpp::Timer$<$ T, CLOCK_T $>$, qpp::internal::IOManipPointer$<$ PointerType $>$, and qpp::internal::IOManipRange$<$ InputIterator $>$.

7.12.3.2 IDisplay& qpp::IDisplay::operator= (const IDisplay &) `[default]`

7.12.3.3 IDisplay& qpp::IDisplay::operator= (IDisplay &&) `[default]`

7.12.4 Friends And Related Function Documentation

7.12.4.1 std::ostream& operator$<<$ (std::ostream & *os,* const IDisplay & *rhs*) `[friend]`

7.41.1 Detailed Description

Singeleton class that manages the source of randomness in the library.

Consists of a wrapper around an std::mt19937 Mersenne twister random number generator engine and an std↩
::random_device engine. The latter is used to seed the Mersenne twister.

Warning

This class DOES NOT seed the standard C number generator used by Eigen::Matrix::Random(), since it is
not thread safe. Do not use Eigen::Matrix::Random() or functions that depend on the C style random number
engine, but use qpp::rand() instead!

7.42.1 Detailed Description

template$<$typename T$>$class qpp::internal::Singleton$<$ T $>$

Singleton policy class, used internally to implement the singleton pattern via CRTP (Curiously recurring template pattern)

To implement a singleton, derive your class from qpp::internal::Singleton, make qpp::internal::Singleton a friend of your class, then declare the constructor and destructor of your class as private. To get an instance, use the static member function qpp::internal::Singleton::get_instance() (qpp::internal::Singleton::get_thread_local_$\hookleftarrow$ instance()), which returns a reference (thread_local reference) to your newly created singleton (thread-safe in C++11).

Example:

```
class MySingleton: public qpp::internal::Singleton<MySingleton>
{
      friend class qpp::internal::Singleton<MySingleton>;
public:
    // Declare all public members here
private:
    MySingleton()
    {
        // Implement the constructor here
    }
    ~MySingleton()
    {
        // Implement the destructor here
    }
};

MySingleton& mySingleton = MySingleton::get_instance(); // Get an instance
thread_local MySingleton& tls = MySingleton::get_thread_local_instance();
// Get a thread_local instance
```
